Bioblock®
A BIOMECHANICAL AND BIOLOGICAL CONCEPT
• The prosthesis is joined to the implant by an intermediate transepithelial, screwed into the implant.

• The surface of each integral component (implant and transepithelial) is adapted specifically to the different tissues it will interact with.

BIOLOGICAL SEAL

The bond between the tissue and the transepithelial is established at the moment it is inserted.

The prosthesis can be removed easily without damaging this junction, as the prosthetic platform is located at the gingival level.

PROSTHETIC VERSATILITY AND REVERSIBILITY

BTI transepithelialis ensure the reversibility of the screw-retained prosthesis, enabling the height to be modified in situations of gingival morphology alterations.

BIOMECHANICAL IMPROVEMENT

By using 2 screws, the Bioblock concept ensures a better distribution of the stress in the joining components, optimizing the mechanical behavior.

They are screw-retained to the implant at 35 Ncm and the screw that retains the prosthesis to the transepithelial at 20 Ncm.

GUARANTEE OF HERMETIC SEAL

The right design and high-precision machining of the BTI transepithelialis’ connection provides a hermetic seal at the implant-platform level and therefore prevents bacterial invasion.

INSTANT STABILITY

The surface topography of the BTI implant system (triple roughness modified with calcium ions) maximizes the initial anchoring of the implant to the bone.
To achieve the biomechanical and biological advantages of the BioBlock® concept, BTI has developed a wide range of transepithelials, available for all platforms of its implant system.

**UNIT® TRANSEPIHELIAL**

**SINGLE RESTORATIONS (SCREW-RETAINED) AND COMPONENTS OF CHOICE FOR IMMEDIATE LOADING**

**STRAIGHT UNIT**
- Internal connection to the prosthesis
- Tetra-lobed connection to the implant
- Heights: 1.5 - 2 - 2.5 - 3 - 3.5 - 4 mm
  (HEIGHTS of Universal Platform Interna connection)

**EXPANDED UNIT UNIVERSAL**
- Prosthesis: 5.5 mm
- Gingival: 4.1 mm
- Heights: 2 - 2.5 - 3 - 3.5 - 4 mm
  (HEIGHTS of Universal Platform Interna connection)

**EXPANDED transepithelials change the platform (from Universal to Wide) and are indicated for rear-lower areas where a wider prosthetic emergence and greater preservation of soft tissue are needed.**
WORKFLOW with UNIT®

Conventional workflow

1. Impression Making
2. Laboratory Model
3. Conventional Manufacturing Process
4. Machining

Digital workflow

1. Digital Impression Taking and Scanning
2. Computer Design
3. Model Impression and Analog Insertion
4. Machining
The Multi-Im® Transepithelial is designed to provide multiple restorations (screw-retained) and components of choice for immediate loading.

It allows a divergence between implants of up to 56°, making it easier to take impressions and screw in the prosthesis with an excellent passive fit without the risk of stress on the implant or the prosthesis.

**Maximum Angulation Supported by a Multi-Im®**

**Straight Multi-Im**
- Rotating connection to the prosthesis

**Expanded Universal Multi-Im**
- Rotating connection to the implant

**Heights of Universal Platform Interna connection:**
- 0.5 - 1 - 1.5 - 2 - 2.5 - 3 - 3.5 - 4 mm

**Expanded transepithelials** change the platform (from Universal to Wide) and are indicated for rear-lower areas where a wider prosthetic emergence and greater preservation of soft tissue are needed.

CONVENTIONAL MANUFACTURING PROCESS

MACHINING
Manufactured from titanium and made up of 2 components:

**Sleeve with Ti Golden® Treatment**

A titanium nitriding treatment that gives biological and aesthetic advantages to the restoration.

**Retention Screw with Ti Black® Treatment**

A new tungsten carbide surface treatment that decreases the friction coefficient and improves the glide, which gives them the same properties as gold in terms of preload and resistance to fatigue.

The hermetic connection of the BTI Implant System and transepithelials provides a seal at the implant-platform level that prevents bacterial invasion. (In vitro studies)
